Pegisai's Granular Value Engineering Introduces Currency-Neutral Liquidity Rails for Global Institutional Settlement

1 October 2026 (Dallas, TX) — As central banks and tier-1 institutions seek structural alternatives to resolve fragmented liquidity in wholesale tokenized asset markets, Pegisai Global Holdings has unveiled the operational mechanics of its **"Granular Value" framework** within the Alkaimi Financial Ecosystem.

Operating as a fully compliant, parallel architecture to traditional cross-border networks, the Alkaimi Ecosystem introduces a structural shift: executing atomic wholesale settlements using direct, granular absolute value, completely bypassing both traditional sovereign currencies and speculative cryptographic tokens.

The traditional global financial system currently relies on sequential clearing processes, localized currency pools, and layered correspondent banking networks. These legacy frameworks create structural drag, settlement opaque zones, and compounding counterparty risk. While current market initiatives focus on stablecoins or digital sovereign debt instruments, these mechanisms inherit the core vulnerabilities of underlying inflation (currency debasement), sovereign debt exposure, and fluctuating currency exchange values.

The Alkaimi model decouples settlement utility from sovereign debt instruments. By utilizing a currency-neutral rail, institutional entities can settle obligations in the Digitized Tangible Asset (DTA) a monetary mechanism tied directly to audited, physical tangible assets held in immutable custody. Pegisai's absolute-value approach allows transacting entities to execute real-time, wholesale settlement finality without the cross-currency friction or foreign exchange hedging costs typically required in multi-currency corridors.

"The true evolution of institutional treasury operations is not about moving tokenized versions of existing fiat liabilities faster," said Mike Rogers, a Pegisai spokesman. *"True efficiency requires structural finality. Granular Value engineering ensures that transactional velocity is backed by absolute math and physical verification, operating entirely independent of debt-backed sovereign currencies or public blockchain volatility."*

By dividing physical assets across seventeen asset classes into precise granular value assignments, the platform allows global banking systems to interact seamlessly on a single, shared settlement layer. This design meets the singleness test financial supervisors set for money, while ensuring absolute compliance within walled-garden institutional parameters.

Operational deployment is currently scaling through institutional licenses. Financial institutions, market makers, and corporate treasuries seeking to evaluate the empirical data can access the formal documentation on the Pegisai Media Portal.

Value held on the ecosystem’s ledger is held under a custodial agreement. Held value is not a currency deposit and is not insured by deposit insurance or by a government agency such as the FDIC. The settlement mechanisms used in the licensed model are themselves individually insured.

This notice is issued by Pegisai Global Holdings. Supervisory classification of member operations rests with each member’s own regulator. The Alkaimi Ecosystem has not been designated a systemically important financial market utility.

ABOUT PEGISAI GLOBAL HOLDINGS

Pegisai Global Holdings through its foundational deployment of the Alkaimi financial ecosystem, Pegisai establishes parallel, asset-backed settlement solutions that seamlessly integrate with licensed corporate banking infrastructures globally. Pegisai, does not offer banking services, or issues any form of currency. All financial activities conduct within the Alkaimi ecosystem are conducted by chartered financial institutions.
